## NOTIFICATION OF ELECTION

(PCT Rule 61.2)

To:

Assistant Commissioner for Patents  
United States Patent and Trademark  
Office  
Box PCT  
Washington, D.C.20231  
ÉTATS-UNIS D'AMÉRIQUE

in its capacity as elected Office

Date of mailing:

27 January 2000 (27.01.00)

International application No.:

PCT/GB99/02242

Applicant's or agent's file reference:

A25481/WO

International filing date:

14 July 1999 (14.07.99)

Priority date:

17 July 1998 (17.07.98)

Applicant:

LOBLEY, Nigel, Clive et al

1. The designated Office is hereby notified of its election made:

☒ in the demand filed with the International preliminary Examining Authority on:

22 November 1999 (22.11.99)

☐ in a notice effecting later election filed with the International Bureau on:

2. The election ☒ was

☐ was not

made before the expiration of 19 months from the priority date or, where Rule 32 applies, within the time limit under Rule 32.2(b).

## INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference <b>A25481/WO</b>	<b>FOR FURTHER ACTION</b> see Notification of Transmittal of International Search Report (Form PCT/ISA/220) as well as, where applicable, item 5 below.	
International application No. <b>PCT/GB 99/ 02242</b>	International filing date (day/month/year) <b>14/07/1999</b>	(Earliest) Priority Date (day/month/year) <b>17/07/1998</b>
Applicant <b>BRITISH TELECOMMUNICATIONS public limited company</b>		

This International Search Report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This International Search Report consists of a total of 3 sheets.

☒ It is also accompanied by a copy of each prior art document cited in this report.

## 1. Basis of the report

- a. With regard to the **language**, the international search was carried out on the basis of the international application in the language in which it was filed, unless otherwise indicated under this item.

☐ the international search was carried out on the basis of a translation of the international application furnished to this Authority (Rule 23.1(b)).

- b. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, the international search was carried out on the basis of the sequence listing :

☐ contained in the international application in written form.

☐ filed together with the international application in computer readable form.

☐ furnished subsequently to this Authority in written form.

☐ furnished subsequently to this Authority in computer readable form.

☐ the statement that the subsequently furnished written sequence listing does not go beyond the disclosure in the international application as filed has been furnished.

☐ the statement that the information recorded in computer readable form is identical to the written sequence listing has been furnished

2. ☐ **Certain claims were found unsearchable** (See Box I).

3. ☐ **Unity of invention is lacking** (see Box II).

4. With regard to the **title**,

☒ the text is approved as submitted by the applicant.

☐ the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

☒ the text is approved as submitted by the applicant.

☐ the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority.

6. The figure of the **drawings** to be published with the abstract is Figure No.

☒ as suggested by the applicant.

☐ because the applicant failed to suggest a figure.

☐ because this figure better characterizes the invention.

**6**

☐ None of the figures.

## INTERNATIONAL PRELIMINARY EXAMINATION REPORT

(PCT Article 36 and Rule 70)

Applicant's or agent's file reference A25481/WO	<b>FOR FURTHER ACTION</b> See Notification of Transmittal of International Preliminary Examination Report (Form PCT/IPEA/416)	
International application No. PCT/GB99/02242	International filing date (day/month/year) 14/07/1999	Priority date (day/month/year) 17/07/1998
International Patent Classification (IPC) or national classification and IPC H04M3/533		
Applicant BRITISH TELECOMMUNICATIONS public ltd co.et al.		

1. This international preliminary examination report has been prepared by this International Preliminary Examining Authority and is transmitted to the applicant according to Article 36.

2. This REPORT consists of a total of 8 sheets, including this cover sheet.

- ☐ This report is also accompanied by ANNEXES, i.e. sheets of the description, claims and/or drawings which have been amended and are the basis for this report and/or sheets containing rectifications made before this Authority (see Rule 70.16 and Section 607 of the Administrative Instructions under the PCT).

These annexes consist of a total of sheets.

3. This report contains indications relating to the following items:

- I ☒ Basis of the report
- II ☐ Priority
- III ☐ Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- IV ☒ Lack of unity of invention
- V ☒ Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- VI ☐ Certain documents cited
- VII ☒ Certain defects in the international application
- VIII ☒ Certain observations on the international application

# INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No. PCT/GB99/02242

## I. Basis of the report

1. This report has been drawn on the basis of (*substitute sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to the report since they do not contain amendments.*):

### Description, pages:

1-10 as originally filed

### Claims, No.:

1-12 as originally filed

### Drawings, sheets:

1/7-7/7 as originally filed

2. The amendments have resulted in the cancellation of:

- ☐ the description, pages:
- ☐ the claims, Nos.:
- ☐ the drawings, sheets:

3. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):

4. Additional observations, if necessary:

## IV. Lack of unity of invention

1. In response to the invitation to restrict or pay additional fees the applicant has:

- ☐ restricted the claims.
- ☐ paid additional fees.
- ☐ paid additional fees under protest.
- ☒ neither restricted nor paid additional fees.

# INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No. PCT/GB99/02242

2. ☐ This Authority found that the requirement of unity of invention is not complied and chose, according to Rule 68.1, not to invite the applicant to restrict or pay additional fees.
3. This Authority considers that the requirement of unity of invention in accordance with Rules 13.1, 13.2 and 13.3 is
- ☐ complied with.
- ☒ not complied with for the following reasons:
- see separate sheet**
4. Consequently, the following parts of the international application were the subject of international preliminary examination in establishing this report:
- ☐ all parts.
- ☒ the parts relating to claims Nos. 1-4,8-12.

## V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

### 1. Statement

Novelty (N)	Yes:	Claims	
	No:	Claims	1,8
Inventive step (IS)	Yes:	Claims	
	No:	Claims	2-4,9-12
Industrial applicability (IA)	Yes:	Claims	1-4,8-12
	No:	Claims	

### 2. Citations and explanations

**see separate sheet**

## VII. Certain defects in the international application

The following defects in the form or contents of the international application have been noted:

**see separate sheet**

**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT**

International application No. PCT/GB99/02242

---

**VIII. Certain observations on the international application**

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

**see separate sheet**

**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT - SEPARATE SHEET**

---

International application No. PCT/GB99/02242

**With respect to item IV.**

**Lack of unity of invention**

The Applicant is advised that all independent claims must be linked by a single inventive concept (Rule 13.1 PCT). In the present case however, this requirement is not met. There are 2 separate groups of inventions, as follows:

- I. Independent Claims 1 and 8 a telecommunications system and the correspondingly worded method of transmitting a message, using two communication links, one for control signals the other for the one-way transmission of messages, with the dependent Claims 2 to 4 and 9 to 12.
- II. Independent Claim 5 claiming telecommunication equipment receiving control signals that represent prompts, with the dependent Claims 6 and 7.

These two groups of inventions could be implemented independently of each other and share neither an inventive concept (Rule 13.1 PCT), nor special technical features or method steps (Rule 13.2 PCT).

As the Applicant has not responded to the invitation (see form 405) to restrict the claims or pay additional fees, the preliminary examination report will be established on those parts of the international application appearing to be the main invention, namely invention I (Article 34(3)(c) PCT).

**With respect to item V.**

**Reasoned statement under Rule 66.2(a)(ii) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement**

---

**I**

The following document is referenced for the first time in this written opinion; the numbering will be adhered to in the rest of the procedure:

D1: WO 96 32802 A (SIEMENS AG ;SEBESTYEN ISTVAN (DE)), 17 October 1996 (1996-10-17)

**II**

1. The subject-matter of Claim 1 is not novel in the sense of Article 33(1) and (2) PCT.

This can be seen with respect to document D1 (see in particular pages 3 to 7, figures 1 and 2, Claims 1 and 2) that discloses according to **all** the features of Claim 1:

*A communications system (Figure 1) comprising*

*Transmission means for transmitting a message (Telefonnetz) from a remote terminal (e.g. video I/O Geräte or Audio I/O Geräte) for storage in a message storage means (Elektronisches Postsystem), and/or transmitting a message retrieved from a message storage means (Elektronisches Postsystem) to a remote terminal (e.g. video I/O Geräte or Audio I/O Geräte), transmission means (Telefonnetz) for transmitting, over a relatively narrow bandwidth communication link, control signals for controlling (Steuerungskanal; page 3, paragraph 2; page 4, paragraph 4; page 5, paragraphs 2 and 4; page 7, paragraph 3) the operation of the message storage means (Elektronisches Postsystem), and*

*network control means (e.g. Netzsteuerung) for establishing a relatively broad bandwidth communication link for transmission of the message to or from (e.g. Nutzkanäle, flexible Bandbreite; page 5, paragraph 4 to page 6, paragraph 1; page 7, paragraph 3) the message storage means (Elektronisches Postsystem) characterised in that the network control means (e.g. Netzsteuerung) is arranged to establish a one-way broad bandwidth communications link in the direction in which the message is to be transmitted (page 7, paragraph 2, see also ITU-T H.245, to which the patent application refers: sections Unidirectional Logical Channel signalling procedures and Bidirectional Logical Channel signalling procedures. N.B. signalling is considered to be comprised within the term communication.*

2. The independent Claim 8, although phrased as a method claim, is nonetheless a mere repetition of the subject-matter of system Claim 1. The same objection applies to this claim and the attention of the Applicant is thus drawn to point V.II.1.
3. It should be noted that even if the Applicant were to interpret Claim 1 or 8 in such a manner as to enable him to allege that its subject-matter were novel, based on minor differences between features of this claim and those disclosed in D1, the subject-matter of Claim 1 would still not involve an inventive step, Article 33(3) PCT, with respect to the disclosure of D1 especially as this document discloses the same object and the same type of solution as claimed in the claims.
4. The subject-matter of dependent Claims 2 to 4 and 9 to 12 does not add anything of inventive significance to the independent Claims 1 or 8 respectively, because the claims can either be directly derived from the prior art as cited above or their subject-matter is considered common general knowledge of the person skilled in the art.

**With respect to item VII.**

**Certain defects in the international application**

1. To meet the requirements of Rule 6.3(b) PCT the independent claims should have been cast in the **correct** two-part form, with those features known in combination from the prior art (see document D1) being placed in a preamble (Rule 6.3(b)(i) PCT) and with the remaining features being included in a characterising part (Rule 6.3(b)(ii) PCT).
2. Due to the pertinence of the document D1 the Applicant should also have indicated in the letter of reply the difference of the subject-matter of the claims (or any new claims to be filed) vis-à-vis the state of the art and the significance thereof, so as to aid in the determination of an inventive step.

**With respect to item VIII.**

**Certain observations on the international application**

1. Claims 1 and 8 do not meet the requirements of Article 6 PCT in that the matter for which protection is sought is not clearly defined. The claims attempt to define the subject-matter in terms of the result to be achieved which merely amounts to a statement of the underlying problem. The **technical features** necessary for achieving this result should be added.
2. The relative terms "relatively broad", "relatively narrow", "broad" and "narrow" used throughout the claims have no well-recognised meaning and leave the reader in doubt as to the meaning of the technical features to which they refer, thereby rendering the definition of the subject-matter of the claims unclear (Article 6 PCT). Should the Applicant wish to leave the words relatively narrow/broad then it should be made clear that it is relative to the other one of the two channels that is being used.

(54) Title: TELECOMMUNICATIONS MESSAGING SYSTEMS

## (57) Abstract

A message retrieval system is arranged to allow control functions to be carried in out-of-band signalling channels, thereby allowing a reduced bandwidth to be required for message storage and retrieval. In particular, storage or retrieval can be carried over a simplex broad bandwidth link, as no broad bandwidth signal is transmitted in the reverse direction. When a user (3) accesses the message facility (1), a signalling connection (7) is first set up. The message facility (1) may use calling line identity to identify which messaging address is required, and whether the calling terminal has the out-of-band signalling capacity. A simplex voiceband connection (6) is then set up from the message bank (1) to the terminal (3), and prompts are transmitted over this connection to the user. The user, on receiving such prompts responds with signals entered on the keypad or other data entry device of his terminal (3), and these are transmitted over the signalling connection (7) to control the further operation of the message bank, and in particular to cause it to transmit selected messages (step 78) over the wide bandwidth link (6) to be received by the user (3).

### Telecommunications Messaging Systems

The invention relates to voicebank and other messaging applications in telecommunications systems. Such applications are now becoming commonplace, allowing communication to be made between a calling party and a called party without the need for both to be available simultaneously. A called party may be unable or unwilling to answer the telephone when a call is made, for example because he does not wish to be disturbed, or he is not present. In such circumstances a voicebank system can be used to divert incoming calls to a messaging service, which comprises a data store in which a message can be left for subsequent retrieval by the party for whom the call was intended.

Some voicebank systems are provided as part of the telephone terminal equipment, (so-called "telephone answering machines") but, increasingly, network operators are providing the facility as part of the network itself. This reduces terminal complexity, and allows messages to be left even when connection to the destination terminal is not possible, for example because it is engaged on another call or, (if it is a mobile terminal) because it is out of radio range of a base station or is switched off.

Systems operating on the same basic principles are also known for storing data messages (for example facsimile transmissions) when the destination terminal is unavailable, for subsequent retrieval by the called party. In the following specification, the term "message bank" will be used to cover any such service, whether storing voice or data messages. It is envisaged that any type of message, for example data or video, may be sent according to the system of the invention, according to the capabilities of the terminal equipment used.

In a typical message bank system, a calling party, on being connected to the message bank system, receives a prompt inviting the caller to leave a message. In a voicebank system, the prompt is generally a spoken message, which may be a recording or may have been generated synthetically. For a facsimile message the prompt is the "handshake" code transmitted by the receiving machine to prompt the calling facsimile machine to transmit at a rate which does not exceed the capabilities of the receiving machine. Any message transmitted by the calling party is stored in the message bank. The message may be stored in any suitable form. Network-based systems generally store the messages in digital form,

as do some terminal-based systems, but many terminal-based voicebank systems use magnetic tape to record an analogue signal.

When the called party wishes to access his message bank, he transmits a command to the message bank system. For a terminal-based system, this merely  
5 requires appropriate keypad commands on the terminal equipment. If the system is network-based, the command must include information to identify which user is calling. For many network-based systems this information is generated automatically, using calling line identity (CLI), or identification codes such as the user identity code (IMSI) which identifies the SIM (subscriber identity module) of a  
10 mobile terminal operating according to the GSM (Global System for Mobile communications) standard. Control of the system requires specific commands, such as "play next message", "repeat this message", "delete message" to be transmitted. These are generally transmitted to the network functionality using key-entry commands, which are transmitted using DTMF (dual tone multiple  
15 frequency) codes or the like.

It is known for example from International Patent Specification WO96/32802 (Siemens) to provide a communications system comprising

transmission means for transmitting a message from a remote terminal for storage in a message storage means, and/or transmitting a message retrieved from  
20 a message storage means to a remote terminal,

transmission means for transmitting, over a relatively narrow bandwidth communications link, control signals for controlling the operation of the message storage means, and

network control means for establishing a relatively broad bandwidth  
25 communications link for transmission of the message to or from the message storage means.

Network capacity is a scarce resource, particularly with the increasing demand for high-bandwidth services such as high-speed data and real-time video services. Analogue speech channels also require a wide bandwidth. It is therefore  
30 desirable to avoid the unnecessary allocation of bandwidth when it is not required for the service requested.

According to the invention, a communications system of this type is characterised in that the network control means is arranged to establish a one-way

broad bandwidth communications link in the direction in which the message is to be transmitted.

The invention may be used with network-based message banks or terminal-based message banks.

5           In a preferred arrangement the relatively broad bandwidth communications link is a traffic channel suited to the nature of the message to be stored (voice, data etc) whilst the relatively narrow bandwidth communications links are out-of-band signalling channels. This arrangement reduces the network resources required to operate the system. Separation of the control signals from the channel carrying  
10 the message itself allows the use of a simplex (one-way) channel for the relatively broad bandwidth message-carrying channel. By eliminating the need for the return channel, network capacity can be improved. The one-way channel may also carry any control signals to be transmitted in the same direction, which in turn allows the use of a simplex narrow-bandwidth channel to be used for control signals in  
15 the reverse direction.

The invention may comprise means for identifying whether the remote terminal requires transmission and/or receipt of control signals over a relatively broad bandwidth communications link in the direction contrary to that in which the message is to be transmitted, and can be arranged to establish a one-way broad  
20 bandwidth link if the said terminal does not require such a broad bandwidth link in the reverse direction, and to establish a two-way broad bandwidth link if the said terminal requires such a broad bandwidth link. The invention may further comprise means to convert the two-way broad bandwidth link to a one-way broad bandwidth link during the course of a call should the requirement for a broad  
25 bandwidth link in the reverse direction cease. The invention may alternatively comprise means to reverse the sense of the one-way broad bandwidth communications link during the progress of a call.

The invention also extends to telecommunications terminal equipment for use with the system defined above, comprising means for receiving said control  
30 signals over a relatively narrow band channel, and converting said control signals into prompt signals readable by the person or machine transmitting or receiving the message. Such terminal equipment may be the message storing terminal, or the terminal by which the message storing service is accessed to send or retrieve messages.

According to a further aspect, the invention comprises a method of transmitting a message from a remote terminal to a message storage means, or retrieving a message from a message storage means, over relatively broad bandwidth communications links, wherein signals for controlling the operation of the message bank system are transmitted over relatively narrow bandwidth communications links, characterised in that a one-way broad bandwidth communications link is established in the direction in which the message is to be transmitted.

The invention is suitable for message deposit and for message retrieval, provided in each case that the terminal used allows the processing of out-of-band signalling. For message retrieval the relatively broad bandwidth link used for transmitting the requested messages can also be used for transmitting voice prompts and the like. However, for message deposit to be carried out in this way, the originating terminal requires a facility for processing and displaying prompts and other signals received from the network in the out-of-band format. As the system is preferably compatible with existing terminals and networks (including the traditional Public Switched Telephone Network (PSTN)) it will not always be possible to operate message deposit in this way. In appropriate circumstances the invention may be used to support only message deposit, or only message retrieval. It may also be used selectively, operating in a mode according to the invention only in respect of suitable terminals, and/or only in respect of message retrieval, being used in a second, conventional, mode otherwise.

Embodiments of the invention will now be described, by way of example only, with reference to the drawings, in which:

Figure 1 is a schematic diagram showing the general arrangement of a message-bank system in which messages are stored in a conventional manner;

Figure 2 is a schematic diagram showing the general arrangement of a message-bank system in which messages are stored in a manner operating according to the invention

Figure 3 is a diagram illustrating the operation of the system of Figure 2.

Figure 4 is a diagram illustrating an alternative method of operation of the system of Figure 2.

Figure 5 is a schematic diagram showing the general arrangement of a message-bank system in which messages are retrieved in a conventional manner;

Figure 6 is a schematic diagram showing the general arrangement of a message-bank system in which messages are retrieved in a manner operating according to the invention.

Figure 7 is a diagram illustrating the operation of the system of Figure 6.

5 In Figures 1, 2, 5 and 6 there is shown a message bank 1. In the preferred embodiment this is a network-based message bank, but in Figures 1 and 2 it may instead be a terminal-based system, more commonly known as an "answering machine". In such systems, of course, retrieval takes place at the user's terminal, without the use of the network. The messaging system is connected through a  
10 telecommunications network 2 to a terminal 3. In Figures 1 and 2 this is the terminal used by the calling party to leave a message, whereas in Figures 5 and 6 it is the terminal used by the called party to retrieve the message. The connection 4, 5 is capable of supporting the message in the format in which it is transmitted (speech, broadband data, etc) and is a conventional duplex link 4 in Figures 1 and  
15 5. In Figure 2 it is a simplex (one-way) link 5 from the terminal 3 to the message bank 1, whilst in Figure 6 it is a simplex (one-way) link 6 in the converse direction. An "out-of-band" signalling channel 7 is also shown in the Figures. This signalling channel 7 may in practice be the signalling channel used in initially setting up the call; however in Figures 2 and 6 separate simplex signalling channels (operating in  
20 the sense indicated) may be employed for the additional signalling to be discussed with reference to those figures. The network 2 is controlled by a network control system 8 which is typically an "Intelligent Network" (IN) platform.

In the prior art arrangement shown in Figure 1, the voice messaging system operates as follows. When a call is set up over a telecommunications  
25 system, the network control system 8 first sets up a signalling connection 7, which provides the various call set-up functions including the provision of ringing tone, etc. When the called party answers, this is recognised by the network control system 8 which sets up a full telephone connection 2. In the arrangement of Figure 1, when a caller 3 attempts to make a telephone call, the network control  
30 system 8 diverts the call through the network 2 to the message bank 1. This may occur because the called party has set up the diversion manually. Alternatively, the settings of the network control system 8 may cause automatic diversion if the called party's telephone does not respond, is busy on another call, is switched off or (for a mobile telephone) is out of range of the base station network. Network-

based message banks 1 have separate addresses for each telephone served by the network, and calls to the message bank 1 are routed to the address corresponding to the called number.

The network control system 8, on connection of a telephone 3 to an address in the message bank 1, first establishes a signalling link 7. If the call is connected, a conventional telephone connection 4 is set up over the network, over which prompts are sent to the caller 3 from the message bank 1, inviting the caller 3 to leave a message. These prompts are conventionally in the form of synthesised or recorded speech, suitable for the telephone connection. The calling party 3 can then transmit a spoken message over the connection 4 for storage in the appropriate address of the message bank 1, for subsequent retrieval.

If the calling party 3 is a facsimile machine or computer modem, the nature of the signals to be stored in the message bank 1 will be different, and in order to correctly co-operate with the calling party 3, the prompts transmitted from the message bank have to be appropriate. For example, a human listener cannot interpret or generate the speech-band signals used to control facsimile machines. Similarly, facsimile machines and modems will not respond to voice prompts. The selection of the appropriate prompt can be achieved by having separate message bank facilities for speech and data, requiring diversion to different numbers. Alternatively, a single message bank 1 may be made capable of identifying the various "handshake" signals generated by different types of calling device, and transmitted over the telephone connection 2 when first set up. In response, the message bank 1 transmits a prompt of the type appropriate to the type of caller.

Figure 5 shows the message retrieval process for a conventional message bank system. When a user 3 wishes to access the message bank, he dials a number to establish a conventional telephone connection 4 to the message accessing function of the message bank 1. The message bank 1 may identify the user's individual address within the message bank 1 by using calling line identity (CLI) signals transmitted over the signalling connection 7 during call set-up. The message bank 1 next transmits a prompt to the user over the newly-established telephone connection 4. The format of this prompt may be a voice message, or a facsimile or modem "handshake", depending on the nature of the messages stored in the message bank, and/or the nature of the terminal 3 making the call. If the desired message bank address has not already been identified by CLI, as described

above, this prompt may request the user 3 to identify the address required. This allows a user to access his message bank. Password protection may be used to avoid unauthorised access.

The user may control the playback of messages stored in the message bank 1 using commands transmitted from his terminal 3 over the telephone connection 4. For example a user may wish to list the messages (by time, calling number, or other characteristics), play a message from the list (next, previous etc), or delete a message. The control commands are typically transmitted as DTMF (dual tone multiple frequency) signals over the telephone connection 4.

10 The system according to the invention will now be described with reference to Figures 2, 3, 4, 6 and 7. As has been described above, the invention is primarily concerned with message retrieval, but it may also be used for message deposit and this will be described first, with reference to Figures 2 and 3.

When an incoming call is routed to the message deposit function of the message bank 1, (step 31, Figure 3) the network control system 8 identifies that the called party is a message bank (step 32) and establishes a one-way (simplex) telephone connection 5 to the message bank (step 33). No channel is established in the reverse direction, apart from the signalling connection 7 established during the initial call set-up process 31/32. Since channels are generally allocated in pairs (e.g. frequency pairs in radio communications, wire pairs in fixed networks), simplex operation releases the partner channel for other purposes. If the calling party 3 is a mobile telephone, it may be connected to the radio base station using an uplink radio channel which would otherwise be unusable, for example because the signal quality on the corresponding downlink channel is below acceptable limits. In the more general case, where both paths are usable, they may be used to provide two independent simplex links. In particular, there are network paths which, if used as conventional duplex paths, would suffer from echo (the return on one path of a signal transmitted on the other, resulting from acoustic or electrical feedback between the two channels). Parts of these paths may nevertheless be usable as independent simplex links, as the connection from which the feedback would have originated would not form part of both links.

Unlike the prior art arrangement of Figure 1, the prompts that are sent from the message bank 1 to the user 3 (step 34) are carried in out-of-band signalling using the signalling channel 7. This requires that the calling party 3 is

able to read and process such signals (step 35). This may be achieved by using specialised terminal equipment 3 capable of operating with such signalling. Alternatively, the out-of-band signals may be converted to conventional in-band prompts at some intermediate point in the network. This intermediate point may be the local exchange (or mobile switching centre for a mobile telephone) to which the user terminal 3 is connected - in this case the connection between that intermediate point and the user 3 would then be by conventional duplex link.

The network control system 8 may recognise whether the terminal 3 is of a type suitable for handling such out-of-band prompts, and establish a link 4,5 of appropriate type (simplex or duplex) accordingly, either between the user terminal 3 and the intermediate point (the rest of the link to the message bank being simplex), or throughout between the user terminal 3 and the message bank 1.

The prompts may control a display to give instructions to the user of the terminal 3. The terminal 3 may convert the prompts into instructions (voice or visual display), for example telling the user when to speak. In the case of a facsimile or computer modem connection, the prompt may control the machine at the terminal 3 to cause it to transmit its data, for example using "Internet Protocol" (IP). The message to be stored can then be transmitted (step 38) over the simplex link 5 to be stored (step 39) in the message bank 1.

The message bank 1 may be customer-provided terminal equipment, or it may be associated with the network equipment 2.

In an alternative arrangement, illustrated in Figure 4, the network control system 8 initially sets up a conventional duplex broad bandwidth link 4 (step 42) in response to the call set-up request (41). The message bank 1 sends the "prompt" message (step 44) over the "down" (message bank to caller) leg of this duplex link 4. The message bank 1 then sends a command 46 to the network control system 8 to drop the "down" leg, (step 47) to leave only the "up" leg, thereby forming a simplex link 5 in the "up" direction. The caller, on receiving the prompt (step 45), responds to it by sending his message (step 48) over the simplex link 5 to be received by the message bank 1 (step 49).

Instead of establishing a full duplex link 4 and then dropping one leg of it, a time division duplex arrangement may be employed, as also illustrated in Figure 4. In this process the network control system 8 initially sets up (step 42) a simplex link 6 from the message bank 1 to the user terminal 3. This is used to send the

prompt (step 44), and then the direction of the simplex link is reversed (step 47) to create a simplex link 5 over which the message can be transmitted.

Message retrieval operates in the manner illustrated in Figures 6 and 7. When a user 3 accesses the message facility 1 (step 71), the network control system 8 first sets up a signalling connection 7. The message facility 1 may use calling line identity to identify which messaging address is required, and whether the calling terminal has the out-of-band signalling capacity (step 72). A simplex voiceband connection 6 is then set up from the message bank 1 to the terminal 3 (step 73), and prompts are transmitted over this connection to the user (step 74).  
10 The user, on receiving such prompts (step 75) responds with signals entered on the keypad or other data entry device of his terminal 3 (step 76), and these are transmitted over the signalling connection 7 to control the further operation of the message bank 1 (step 77), and in particular to cause it to transmit selected messages (step 78) over the wide bandwidth link 6 to be received by the user 3  
15 (step 79).

Although messages may be sent from any terminal for deposit in the message bank, the terminal 3 used to retrieve messages is generally the user's own terminal, which can be designed to be compatible with the network with which it operates. In particular, it can be provided with the means to generate out-of-band signals. However, as already mentioned, a user may use other terminals 3 to access his message facility 1 (subject to password control, etc), and such other terminals may not all have the out-of-band signalling facility. In such cases conventional duplex provision may need to be provided for all or part of the connection through the network 2. This may take the form of conversion at some  
20 point in the network 2 between DTMF tones and out-of-band signals. The selection of simplex or duplex operation may be made by the network control system 8 during the call set-up process, by monitoring the signals sent over the signalling channel 7 by the terminal 3 (step 72). This may be done either by identifying the terminal as simplex-compatible from its calling line identity, or by  
25 assessing whether it responds to the first prompt sent to it by transmitting an in-band signal (thereby signifying a duplex connection is required) or an out-of-band signal (signifying it is suitable for operation in simplex mode)  
30

As discussed above, the message bank 1 may be customer-provided terminal equipment, or it may be associated with the network equipment 2, for

example at a switch. In the former case, of course, network facilities are only required for retrieval if the messages are being accessed remotely, from another terminal 3.

The out-of-band signals used may be according to any suitable protocol, 5 such as "CLASS" or "Internet Protocol" (IP). The invention is particularly suited for use in multi-media networks, which have advanced add/drop bearer capabilities to allow asymmetric data transfer.

**CLAIMS**

1. A communications system comprising  
5 transmission means (2) for transmitting a message from a remote terminal (3) for storage in a message storage means (1), and/or transmitting a message retrieved from a message storage means (1) to a remote terminal (3),  
transmission means (2) for transmitting, over a relatively narrow bandwidth communications link (7), control signals for controlling the operation of the  
10 message storage means (1), and  
network control means (8) for establishing a relatively broad bandwidth communications link (5) for transmission of the message to or from the message storage means (1)  
characterised in that the network control means (8) is arranged to establish  
15 a one-way broad bandwidth communications link (5) in the direction in which the message is to be transmitted.
2. A communications system according to claim 1, the network control means (8) being arranged to identify whether the remote terminal (3) requires transmission  
20 and/or receipt of control signals over a relatively broad bandwidth communications link in the direction contrary to that in which the message is to be transmitted: and arranged to establish said one-way broad bandwidth link (5) if the said terminal does not require such a broad bandwidth link in the reverse direction, and to establish a two-way broad bandwidth link (4) if the said terminal (3) requires  
25 transmission of control signals over such a broad bandwidth link.
3. A communications system according to claim 2, the network control means (8) further comprising means to convert the said two-way broad bandwidth link (4) to a one-way broad bandwidth link (5) during the course of a call when the  
30 requirement for a broad bandwidth link in the reverse direction ceases.
4. A communications system according to claim 3, wherein the control means (8) comprises means to reverse the sense of the one-way broad bandwidth communications link (5) during the progress of a call.

5. Telecommunications equipment (1,3) for use with the system of claims 1 to 4, comprising means for receiving said control signals over a relatively narrow band channel (7), and converting said control signals into visible or audible prompt  
5 signals readable by the human or machine transmitting or receiving the message.

6. Telecommunications equipment according to Claim 5, being a message storing terminal (1).

10 7. Telecommunications equipment according to Claim 5, being a terminal (3) by means of which a message storing service can be accessed to send or retrieve messages.

8. A method of transmitting a message from a remote terminal (3) to a  
15 message storage means (1), or retrieving a message from a message storage means (1), over relatively broad bandwidth communications links (5), wherein signals for controlling the operation of the message bank system are transmitted over relatively narrow bandwidth communications links (7) and characterised in that a one-way broad bandwidth communications link (5) is established in the  
20 direction in which the message is to be transmitted.

9. A method according to claim 8, wherein it is determined whether the remote terminal requires transmission and/or receipt of control signals over a relatively broad bandwidth communications link in the direction contrary to that in  
25 which the message is to be transmitted; and said one-way broad bandwidth link (5) is established if the said terminal does not require such a broad bandwidth link in the reverse direction, and a two-way broad bandwidth link (4) is established if the said terminal requires such a broad bandwidth link.

30 10. A method according to claim 9, wherein said two-way broad bandwidth link (4) is converted to a one-way broad bandwidth link (5) during the course of a call when the requirement for a broad bandwidth link in the reverse direction ceases.

11. A method according to claim 8, wherein the sense of the one-way broad bandwidth communications link (5) is reversible during the progress of a call.

12. A method according to any of claims 8 to 11, wherein said control signals  
5 received over a relatively narrow band channel (7) are converted into visible or audible prompt signals readable by the human or machine transmitting or retrieving the message.
